

## Malaria in Kenya, Africa

From the dashboard shown above of a map of Africa, I chose Kenya to write my report about as it is the most affected country of number of deaths in Africa with average deaths every year of 27,896 and average deaths everyday of 76.43.

As it shows in the graph on the left, numbers of deaths have started strongly in 2000 with nearly 50K deaths that year. Sadly, the numbers haven't decreased since 2000 but remained nearly the same of 47K to 49K deaths each year.

Until 2003 where numbers have risen suddenly and reached about 60K deaths that year. After the year 2003, number of the deaths decreased dramatically in 2004 until it reached almost 25K, where it was the lowest rate of deaths in four years, according to the dataset. However, a year later, number of deaths returned rising back to how high it was in the previous years. Overall, the number of Malaria deaths was at its lowest after 2010, as it's illustrated in the chart, with a very low number of deaths.
